## (54) MASTER INFORMATION CARRIER AND METHOD FOR RECORDING MASTER INFORMATION SIGNAL ON MAGNETIC RECORDING MEDIUM

(57)Abstract:

PROBLEM TO BE SOLVED: To track highly accurately in an area of a high track density, by forming projections and recesses corresponding to information signals on and in a surface of a base body and forming a ferromagnetic thin film at least on a surface of the projections of the projections and recesses.

SOLUTION: Projections and recesses corresponding to information signals are formed on and in a surface of a base body. A surface of at least the projections of the projections and recesses is constituted of a ferromagnetic material. A surface of the thus-obtained master information carrier is brought in touch with a surface of a sheet-like or disk-like magnetic recording medium 5 with a ferromagnetic thin film or ferromagnetic particle-applied layer, whereby a magnetization pattern corresponding to the projections and recesses on the surface of the master information carrier 4 is recorded to the magnetic

recording medium 5.
